The first time we've seen Microsoft Office 2013 included in this list, it's probably because its reliability is actually very good, with the only occasional instability problem usually being solved with simple software updates and all. However, for some unknown reason, Office 2013 has been returned to the list this time around. The reasoning is simple – there's a plethora of glitches and also applications that specifically target it, thus claiming to be able to fix all of its problems. If that wasn't

enough, we also have the Word Analyser Pro which lets you evaluate the security of your documents. In other words, with this Word 2013 pro, it is possible to quickly analyze your documents to determine how safe they are. So, since people find Microsoft Office 2013 extremely reliable, we've come up with the best ways to use it and a list of applications that will help you. The first thing you should know about Office 2013 is that in terms of stability, it's only slightly less reliable than Office 2012. In some sense, this means that more users are

experiencing problems, which, if anything, makes Office 2013 that much more popular among its users. In any case, we've collected some of the most frequently occurring glitches and bugs. The good news is that they are usually fixed within a week or two with a simple Microsoft update. As we've said, Microsoft Office 2013 has one of the most reliable interfaces of any software you could find. However, even though it's a common feature, the most annoying aspect of the interface is its Quick Access to frequently used items, which you can

add to the context menu on almost every object you want to use quickly. However, the biggest problem of Office 2013 is that you can't add any new Quick Access items. The weird part is that these entries are apparently created automatically and, if that's the case, why are you not allowed to make any new ones? Apparently, there is no way to add more Quick Access items to the interface. If you are unable to find such an entry within the interface, we can only hope that this may be the reason as to why so many people with Office 2013 refuse to use the

software. Opening a file in Office 2013 takes around a minute, but it doesn't necessarily mean that it actually opens fast. However, if you know where to look for, you can find a solution to your problem almost immediately. Within the

The decrypted files can then be

uploaded and opened in their respective programs, or imported into a new document. One of the biggest hurdles users experience while working with Office documents is the protection for certain files on a system. The Office system leaves the option open for users to protect their various files, including documents, with a password. This adds a layer of security that some people do not need, but instead take it as an important feature. One of the many reasons why many users often choose to apply a password to

prevent unauthorized access to their files. There are a couple of other ways that users can protect their files, such as the use of a PIN code, which, again, people will often do rather than save their documents and files with a password. We're not saying either of these options are bad, but we also realize that in this day and age, people like the option of having an extra layer of security that is easy to access and use. For those users who do need access to their documents, but simply do not feel like they can handle the maintenance and security of
