AutoCAD uses a client-server architecture. The AutoCAD server is the software that accepts input from users and/or sends the information to other users and/or other CAD applications. The client is the AutoCAD program that displays the drawing in a window. A version of AutoCAD is available for free for personal and educational use. AutoCAD is available in AutoCAD LT, which is a simple, inexpensive (free) version; AutoCAD Standard, a cost-effective version; and AutoCAD LT 2018, a feature-rich version. It is used by CAD technicians (user) to create 2D/3D designs of equipment and infrastructure. AutoCAD is known for having a highly intuitive interface and speed, as well as having the capability to design in multiple dimensions. Also, with the addition of features such as DWG Translator, DWG/DXF Converter, DWG Spatial Translator, and DXF Viewer, AutoCAD helps to keep pace with the growing need for design flexibility. With features such as DraftSight and DWG Exchange, it is possible to collaborate with other designers, allowing CAD users to work more effectively and efficiently in the real-time environment. In addition to its diverse design applications, AutoCAD is used by designers in the transportation, manufacturing, energy, government, construction, and utilities industries. How does it work? An AutoCAD drawing is made up of objects (such as lines, arcs, circles, text, etc.). The objects (or “graphics”) are created by the user or by an AutoCAD program known as a “drafting component.” How can I draw in AutoCAD? 1. Draw a line (straight or curved) 2. Choose an end point and click to draw a line or arc. 3. Choose

\* Function: @controller, :action =>'source', :id => @function\_id %> A number of weeks ago I received my weekly email from Natural News — a newsletter of anti-vax stories and blog posts that I read and share around the internet. Like all the others, it was filled with the usual anti-vaccine propaganda — and the link was to a story from the Washington Times that had been published just a day earlier. That was the very same day the Centers for Disease Control and Prevention (CDC) released a study on whooping cough, a contagious bacterial disease that can kill children under one year old. I can't remember the details about the CDC report, but I have a vague recollection of several of the news stories I read discussing it. One of them was published on the front page of the Washington Times, and featured the headline: “Immunization bills could hit home in NC.” The article, from Feb. 9, 2015, was written by Richard Marshall, a former editor for the newspaper. The story, as I recall, began: “As the national uproar over a proposed law to ban vaccinations continues, a North Carolina bill to require vaccination before attending public school or daycare has been sent to the desk of Gov. Pat McCrory. If signed into law, the bill would also bar parents from homeschooling children.” The whole story is almost entirely focused on the need to vaccinate children to attend public school, not to prevent outbreaks of measles, mumps, and other diseases. Richard Marshall died on Feb. 14, 2015, at the age of 68. After his death, the Washington Times updated its website to say: “Richard Marshall, former editor of the Washington Times and longtime consumer advocate, died on Feb. 14 at age 68 after battling cancer for several years. He had become a nationally recognized advocate for health issues, battling cancer and overcoming vaccine concerns as a whistleblower.◆ a1d647c40b
