Nutrition in psychiatry: the start of a new era. Nutrition has been neglected as a critical component of optimal mental health for more than 50 years. In the past, food, nutrition, and psychiatric practice were separated by culture, religion, education, and knowledge. Throughout history, food and nutrition were considered important only as a medicine or as the basis for good health. The author emphasizes the need to redefine nutrition in psychiatry, including the definition of what is meant by "healthy" food. He also notes that behavior or psychological problems are influenced by the interaction of multiple biological factors, including genes and metabolic processes, as well as eating and learning habits. The author concludes that to succeed in promoting optimal mental health, nutrition has to be considered as a component of mental health, not a modality of medical care.

High-resolution MR imaging of the knee: conventional MR versus high-resolution fluid-sensitive sequence. Our purpose was to study the value of the high-resolution fluid-sensitive sequence in comparison with a conventional high-resolution MR technique. In 30 patients, we prospectively performed a conventional high-resolution examination and a high-resolution fluid-sensitive study with a spin-echo sequence in the same knee joint at the same anatomical level. The sequences were judged equally reliable and, compared with the conventional high-resolution technique, exhibited a slight advantage in delineating the cartilage. The high-resolution fluid-sensitive sequence shows promise in the evaluation of knee disease.
