History of AutoCAD AutoCAD is the most widely used commercial CAD software in the world. As of December 2015, it has been downloaded in excess of 250 million times, with over 120 million licenses sold. It is estimated that over 350,000 AutoCAD users are actively involved in the design community and participating in the software's active development. As of May 2016, around 4,000 new users were signed up each day to AutoCAD's software development community. Autodesk acquired the rights to AutoCAD in 1989. The software was originally developed at VEB Computer and Instrument Design Center in Berlin, West Germany as part of the German military's state-funded project the IKONOS radar system. The first ever version of AutoCAD, Autocad 3, was released in December 1982. It was shipped as an MS-DOS program running on an IBM PC compatible machine.

On November 30, 2016, Autodesk announced that AutoCAD 2019 would be the last release of AutoCAD, and that Autodesk would release a new version of AutoCAD called AutoCAD 360 in Q1 2017. AutoCAD 360 would include new features such as powerful 3D modeling, rendering, file management, and other capabilities, but would not include new features such as block-based design or the ability to import content from other CAD applications. Features A feature of AutoCAD is that its object and layer management system is based on a dependency model, which means that data from other drawing and layer data files are kept as separate layers in AutoCAD. The latest edition of AutoCAD, released in 2013, introduced a new drawing format for 2D drawings, Dynamic Input Method Format (DIMF). DIMF has been a standard format since version 2014 and is supported by third party software applications and the growing number of CAD applications available for mobile devices. DIMF is available in both the desktop and mobile versions of AutoCAD. Elements of DIMF in terms of data format include: The ability to define the relationship between a list of entities. A list of named entities that can be grouped together to form a named entity group. An entity group definition that can be set to support dynamic changes of object families or named entities. The ability to define a relation between two objects and assign a weight to that relation. A list of named
