The CADRE TeamBeta amyloid peptide 42 and methionine 35: implications for Alzheimer's disease. Methionine (M) oxidation of the amyloid peptide, A beta 42, is a potential source of methionine 35 (M35), a free radical oxidation product. M35 is known to stimulate A beta 42 aggregation and produce neurotoxicity. Here, we investigated whether M oxidation is a requisite for A beta 42 neurotoxicity. Both A beta 42 and M35 resulted in similar inhibition of long-term potentiation (LTP) in the CA1 region of the hippocampus. However, M oxidation of A beta 42 was insufficient to produce an additive effect on LTP inhibition. Moreover, pre-incubation with M35 attenuated A beta 42-induced LTP inhibition, implying that M35 acted by competitively blocking a receptor. Thus, M35 and A beta 42 exert a similar but not additive effect on hippocampal LTP, but M oxidation of A beta 42 is not a necessary step for
