Application structure AutoCAD is built using an Object Model, which means that it is structurally built around its objects and their properties. The application consists of: layers which contain drawing and engineering information. Each layer can have additional layers, which may contain objects, properties, equations, text, etc. a variety of drawing tools (drag and draw, measurement, editing, etc.) a database of objects which can be used to generate symbols or forms the ability to save drawings and drawings in various file formats. The Object Model An object is a construct in AutoCAD that can exist in three basic states: Visual - a visual component is a single entity, which is either displayed (visible) or hidden (invisible). An object can be moved, rotated, scaled, and have other visual properties. Visible objects are typically parts of a drawing or model. Property - a property is a combination of a set of attributes, that affect the object's visual appearance or the way it is processed. Properties include: color, alignment, corner types, dimension type, etc. Controlled - the controlled state of an object is what allows it to perform certain actions. Controlled states include: lock, hidden, and deactivated. The Object Model uses the following concepts: Objects - AutoCAD objects are basic building blocks of AutoCAD. They are containers of properties. Objects can have multiple copies or layers which contain objects. In order to keep pace with technological advances, AutoCAD was originally developed from a point of view of a technical drawing tool. For instance, the first versions of AutoCAD created a single, large, non-modal window from which all user interactions (dragging, drawing, and so on) are routed. Since version 3.x, the development of AutoCAD focused on creating a
